

# CodeIgniter Installation

<http://www.codeigniter.com/>

This tutorial will guide you to setup the framework "CodeIgniter" in the public\_html folder of your personal web site at the DAW server. (Substitute 'a999999' with your student number and public\_html with public\_html/LAB if installing in folder "LAB")

## Step 1: Download the zip file

Login to the DEEI network using PuTTY and change to the public\_html folder

```
a999999@daw:~/public_html/$
wget https://github.com/bcit-ci/CodeIgniter/archive/3.1.6.zip

a999999@daw:~/public_html/$ unzip 3.1.6.zip

a999999@daw:~/public_html/$ mv CodeIgniter-3.1.6/* . ;rm -rf CodeIgniter-3.1.6
```

## Step 2: Change the base URL in config.php

```
a999999@daw:~/public_html/application/config$ nano config.php

$config['base_url'] = '~/a999999';
```

## Step 3: Setup the database in database.php

```
a999999@daw:~/public_html/application/config$ nano database.php

$db['default'] = array(
    'dsn' => '',
    'hostname' => '10.10.23.183',
    'username' => 'a999999',
    'password' => 'MyPassword',
    'database' => 'db_a999999',
    'dbdriver' => 'mysqli',
    .
    :
    .
```

## Step 4: Open your browser

Now open your browser and type the following address text box.

<http://all.deei.fct.ualg.pt/~a999999>

## Step 5: (Optional) URL rewriting

To avoid typing "index.php" in the URL, change the Rewrite base in file .htaccess

```
a999999@daw:~/public_html $ nano .htaccess
```

```
<IfModule mod_rewrite.c>
# AllowOverride FileInfo
RewriteEngine on
# Use: RewriteBase /<subdirectory> if installed in subdirectory
RewriteBase /~a999999

# CodeIgniter pages with their own controllers
RewriteCond %{REQUEST_FILENAME} !-d
RewriteCond %{REQUEST_FILENAME} !-f
RewriteRule ^(.*)$ index.php [L]
</IfModule>
```

Give read permission to user www-data:

```
a999999@daw:~/public_html $ chmod g+r .htaccess
```

# CodeIgniter + Smarty

<http://www.coolphptools.com/codeigniter-smarty>

## Step 6: Set up a symbolic link to Smarty library

```
a999999@daw:~/public_html/application/third_party$ ln -s
/usr/share/php/smarty3/ smarty
```

(alternatively, if you want to have your own copy of the Smarty library

```
wget http://intranet.deei.fct.ualg.pt/DAW/smarty.zip ; unzip smarty.zip )
```

## Step 8: Download the Smartie library

The **Smartie** library bridges the gap between Smarty and the CodeIgniter libraries (the name change is necessary to access the library as "smartie" without having a class name collision)

```
a999999@daw:~/public_html/application/libraries$ wget
http://intranet.deei.fct.ualg.pt/DAW/Smartie.zip ; unzip Smartie.zip ; chmod
640 Smartie.php
```

## Step 8: Autoload the Smartie library

```
a999999@daw:~/public_html/application/config$ nano autoload.php

$autoload['libraries'] = array("smartie" => "smarty");
```

## Step 9: Create the Smarty template directories in the views folder

```
a999999@daw:~/public_html/application/views$

mkdir templates
mkdir templates_c
chmod g+rw templates_c
```

Note: the Smarty template directories can be placed elsewhere, just update `Smartie.php` with the correct path
